We have made the necessary arrangements for drillers to be on site tomorrow morning at 7:30 AM to begin installation of 4 recovery wells inside the containment area. Each well will be a 6 in diameter well with a 10' screen that will fully intersect the silty clay layer where the sand seam has been identified during yesterday's drilling and prior drilling along the canal. Attached is an aerial photo of the area showing the tentative locations. As noted each location is tentative and will be adjusted in the field to obtain optimal recovery and avoid any existing structures in the area. Once the wells are installed, we will install a submersible pump in each and pump all possible liquid to a holding tank on site for disposal.

If you have any questions or concerns, please contact me or see me on site first thing in the morning.
